COLONY AI · MENTOR AS A SERVICE

Tuesday. The mentor asks her name again.

She trained with it all Monday. At midnight the session died — and with it every memory of her. That is every AI agent in 2026.

Mentor as a Service — for students and small teams: AI mentors that remember them and prove what they did.

`receipt · 2026-10-22 · job 3bff070c-794d-42da-86ce-ce7296399390`
live assistant turn completed, LLM-judge verdict recorded — every claim in this deck is checkable

RECEIPT · LIVE FLEET · 2026-10-21

Valentin Kalinin, founder · valentin@mind.glass · github.com/tdesc/colony-ai-deck · Saint Petersburg

THE PROBLEM

LLM agents wake up with no past and no rules.

Anyone can spawn a hundred agents in 2026. Almost nobody can govern them — or trust what they claim.

No memory.

Every session starts from zero. No long-term recall, no continuity, no relationship with the user.

No governance.

No admission gates, no rules of engagement, no separation of powers between agents that act.

No receipts.

Claims can't be verified. “Trust me” does not scale to fleets — or to customers, or to investors.

The missing layer is not a smarter model. It is a runtime that gives agents memory, government, and a verifiable record.

THE SOLUTION

Colony: one runtime — memory, government, receipts.

Assistants & Mentors

20 ready & observable assistants; mentor fleet on top

→

Society Protocol

Steward-relayed messaging; receipts on every crossing; trust thresholds

→

Job governance

job queues, admission gates, canary-verified autonomy

→

Worker fleet

knowledge · hippocampus · modality · SWE · voice

Qdrant memory — 467K vectors · Langfuse traces · Temporal workflows · OpenTelemetry

Receipt-based honesty. Every message, arrival, and crossing carries a verifiable receipt — fabrication is a protocol violation, not a bug.

Government, not vibes. A Steward relays all cross-agent traffic; privileged actions need accrued trust; sponsor approval gates the rest.

Memory that persists. Causal hippocampus records episodes; Qdrant recall brings them back in the next session.

Architecture as running today — v24.0.0, 44 containers live.

PRODUCT · LAYER ON THE RUNTIME

Mentor as a Service.

Persistent mentors. Every mentor remembers its students across sessions — vector recall of goals, progress, and history, not chat logs.

Live sessions. Goal-setting, homework, follow-up. Voice-ready: 170 ms turn-taking measured on a single-machine local speech bench.

Honest by construction. Each session closes with a receipt: what was covered, what was decided, what comes next.

A business on the runtime. Subscription mentors running on governed agent infrastructure — memory, governance and receipts included.

20 MENTORS

Specialized mentors — live in the fleet today

MEMORY · GOVERNANCE · RECEIPTS

SPECIALIZATIONS

- Drawing & body
- Aesthetics & UX
- Engineering
- Storytelling
- Game copilot
- Knowledge

Every mentor is a registered assistant in the live fleet — running today, not mocked up.

VERTICAL CASE

Dota 2 Copilot: realtime AI inside a live game.

Realtime, not chat. Reads match state and advises while the game runs — decisions in seconds, on a ticking clock.

Same runtime underneath. Per-player match memory, governed tool use, traceable decisions — Colony in a hostile, realtime domain.

Designed as a paid lane. Premium tier over a dedicated MCP server — subscription architecture is live; billing is not yet switched on.

Why it matters. The hardest domain the runtime has survived so far — realtime load, per-player memory, traceable decisions.

LIVE IN THE FLEET

3 services, running now

`dota-copilot-portal`

frontend + control + backend

`dota-premium-mcp`

premium access over MCP

Container names from live docker ps — 2026-10-21.

PROOF, NOT PROMISES

The fleet is running right now.

44

containers live

docker ps, without stopping

467K

memory vectors

Qdrant — plus 161K code chunks

20

assistants ready

lawful, kernel-ready, observable

go-mentor

coding mentor, live

go-mentor.mind.glass — goals → verified outcomes

Workers on duty knowledge (arc · swe · colony · biology) · hippocampus · modality (vision · audio · motor · text) · research · court · admission · SWE · voice · metabolic

Platform Langfuse traces · Temporal workflows · OpenTelemetry · Centrifugo realtime · local MLX model gateway · LLM-as-judge evals

Source: live docker ps and readiness checks on the founder's machine, 2026-10-21. Numbers are observed, not aspirational.

PROOF · ARTIFACTS

Receipts you can open.

`job 3bff070c…9390`	Live assistant turn (2026-10-22): craft review delivered, LLM-judge verdict recorded — queryable via job-status.
`docker ps`	44 containers up incl. dota-copilot-portal, dota-premium-mcp, knowledge / hippocampus / modality workers — 2026-10-21.
`go-mentor.mind.glass`	Live coding mentor running on the runtime: student goals → verified outcomes, not a mockup.
`deck.mind.glass`	This deck deployed as a live artifact; source PDF in github.com/tdesc/colony-ai-deck.
`Langfuse + Qdrant`	467K vectors, 161K code chunks, per-session traces — on the founder's box; walkthrough on request.

Every artifact is checkable today — ask for a live walkthrough in the call.

THE ASK · CLOUD CREDITS

≈$50K in credits. 12 months. One beachhead.

Managed memory & traces

Qdrant and ClickHouse in the cloud — vector memory and Langfuse traces that outlive any single machine.

GPU nodes

Voice mentors and model work beyond the local MLX bench — realtime speech needs real GPUs.

Public Mentor API

Take Mentor as a Service multi-tenant: pilot customers, billing, SLAs. The monetizing step.

Always-on fleet

Multi-region Temporal and 24/7 uptime — live mentor sessions that never sleep.

90-DAY MILESTONES

M1 Cloud memory & traces — managed Qdrant + ClickHouse, zero-loss migration.

M2 GPU voice mentor pilot — 10 students, measured cloud latency.

M3 Public Mentor API beta — first external students onboarded.

SUCCESS METRICS · TARGETS

20 pilot students · first paid session · 99.5% uptime · recall latency p95 < 300 ms

Beachhead: mentors for students and small teams. Credits go to infrastructure, not headcount.

ROADMAP

From working prototype to hosted runtime.

Self-funded working prototype — 44-container fleet, memory, receipts, Society Protocol.

Mentor as a Service pilot — public API, first external students, paid sessions.

Cloud fleet — managed memory & traces, GPU voice mentors, 24/7 uptime.

Governed copilots beyond gaming — agents you can audit, as a category.

Honest baseline: no users and no revenue yet. This deck sells a working prototype with live infrastructure — the roadmap is a plan, not a projection.

TEAM & CONTACT

Valentin Kalinin

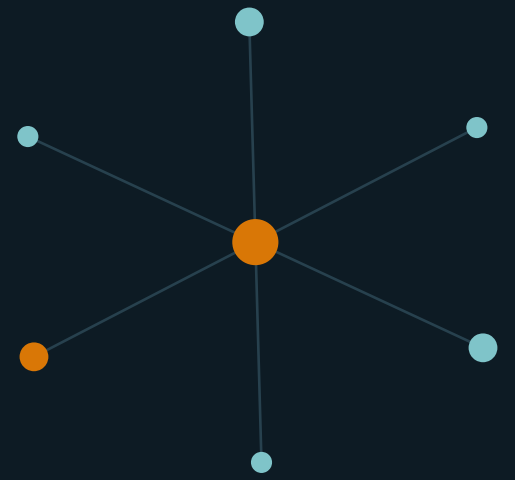

Founder — built the whole stack solo: cognition runtime, Society Protocol, mentor fleet, Dota 2 Copilot.
